

PIXELIUS VITA WORKSPACE - DOCUMENTATION

Overview

Pixelius Vita Workspace is a professional productivity suite designed to automate repetitive asset management tasks. The core logic of this suite relies on a **Strict Name Matching** system to ensure accuracy and prevent manual assignment errors in large-scale projects.

1. PixeliusVita Tool

Access: **Tools > PixeliusVita Tool**

Tab: Mat/Shader (Material Auto-Assigner)

Automatically assigns Materials to GameObjects based on an exact name match.

- **Requirement:** The **Material name** must be identical to the **GameObject/Prefab name**.
- **Folder Restriction:** You must specify a **Material Root Folder**. The tool only searches within this path to avoid picking incorrect assets from other directories.
- **Operation:** Select GameObjects in the Hierarchy or Project window. Upon execution, the tool identifies the matching Material and applies it to all Renderers on the object.

Tab: Texture (Texture Auto-Assigner)

Links Textures to Materials using string-matching logic.

- **Requirement:** The **Texture2D name** must be identical to the **Material name**.
- **Supported Properties:** Automatically detects and fills **_BaseMap** (URP), **_MainTex** (Built-in), or **_BaseTexture** slots.
- **Operation:** Select Materials in the Project window and specify the **Texture Root Folder**. The tool will only bind textures that share the exact same filename as the target Material.

Tab: Color Proc (Texture Color Processor)

Generates hue-shifted or monochrome variations of existing textures.

- **Workflow:** Add textures to the **Source Textures** list and define your **Target Colors**.
- **Output:** Creates new .png files in the source directory with alphabetical suffixes (**_a**, **_b**, etc.).
- **Force Color Mode:** Converts textures to a monochrome style based on the selected target color's hue.

Tab: Prefab Injector

Batch-modifies Prefabs by injecting a predefined list of models.

- **Transform Control:** Supports unique Position, Rotation, and Scale for each injected object.

- **Clean-up Option:** Clear Existing Children allows you to wipe the current Prefab hierarchy before injecting new models.
 - **Usage:** Configure the **Injection List**, select target Prefab assets, and click **Execute**.
-

2. Duplicate With Letters

A workflow extension for clean, non-destructive asset duplication.

Features

- **Naming Convention:** Replaces Unity's default (1) suffix with an alphabetical sequence (a, b, c).
- **Multi-Selection:** Duplicate any number of selected Assets (Files/Folders) or Hierarchy GameObjects at once.
- **Auto-Focus:** Newly created duplicates are automatically selected in the Editor for an immediate workflow.

Access

- **Hotkey:** Alt + D (Standardized shortcut).
 - **Menu:** Right-click in the **Project Window** or use **Edit > Duplicate With Letters**.
-

Important Usage Notes

- **Strict Naming:** This toolset is designed for organized workflows. If a Material is named Stone_01, the corresponding Texture must also be named Stone_01 for the auto-assignment to trigger.
- **Undo Support:** All Hierarchy operations (Material assignment and Prefab injection) are registered with the Unity Undo system.
- **Asset Refresh:** The tool calls AssetDatabase.Refresh() and EditorUtility.SetDirty() automatically to ensure all changes are saved and visible.
